

Greenlea Holsteins Crossugh, Monaghan

Sector: Agriculture

Product: Grolime

Scan for video case study

Greenlea Holsteins is a progressive dairy farm committed to maximising grass growth and maintaining optimum soil fertility. Following soil analysis, the farm identified the need to improve soil pH across key grazing paddocks to enhance nutrient availability and support grassland performance.

To address this, Greenlea Holsteins applied 20 tonnes of Kilsaran Grolime across its farmland. Selected for its high quality and effectiveness, Grolime works quickly to correct soil acidity, helping to unlock valuable nutrients already present in the soil. By improving soil pH, Greenlea Holsteins maximised the efficiency of fertiliser applications, ensuring nutrients were more readily available to support healthier grass growth.

Kilsaran Grolime helps create the ideal soil conditions for productive grassland by regulating pH, improving nutrient uptake and encouraging stronger, healthier sward's. The result is improved grazing performance, better utilisation of existing soil nutrients and enhanced long-term farm productivity. As Padraic Greenan said, "We just let the lime do the talking." For Padraic, the results speak for themselves.

The lime application forms part of the farm's ongoing grassland management programme, supporting increased grass growth, improved fertiliser efficiency and more productive grazing throughout the season. By investing in soil health today, Greenlea Holsteins is helping to maximise the long-term productivity, profitability and sustainability of its dairy operation.
